1. Abstract

This Paper Prsents a novel mathematical Framework, the Universal Rule of Seven (K7 Theory), to explain the spatial distribution of celestial bodies within the Solar System. By deriving a fundamental constant (K) from the Sun-Mercury distance. the model accurately maps the 8 Known planets as integer multiples of this Unit. Furthermore, the theory Predicts a 14-Planet orbital resonance model. Suggesting the existance of six undiscovered or reclassified major bodies in the Trans-Neptunian region.

2. The Fundamental Constant: The K-Unit.

The core of the K7 Theory lies in the septenary division of the Primary orbital distance.

Definition: Let D_m be the mean distance from the Sun's center to Mercury's center (0.387 AU).

Formula: $K = \frac{D_m}{7}$

Constant Value: $K \approx 0.0553$ AU.

3. Mathematical Mapping of the Solar System ($n \times K$).

Each Planet occupies a specific "Harmonic Point" defined by an integer n.

Planet	Mean Distance (AU)	Integer Multiple (n)	Accuracy
Mercury	0.387	7	Base Unit
Venus	0.723	13	99.8%

Earth	1.000	18	99.5%
Mars	1.524	28	98.4%
Jupiter	5.204	94	99.9%
Saturn	9.582	173	99.8%
Uranus	19.189	347	99.9%
Neptune	30.070	554	99.9%

4. The 14-Planet Resonance and The "Great Jump".

The theory posits that the Solar System is not limited to 8 planets but follows a 14-body resonance.

Pluto's Position: n = 714 (102\times 7).

The Trans-Neptunian Gap: A significant "Jump" occurs after Neptune (544 K).

Methodology for Discovery: Future research must utilize 1K incremental scanning (715K, 716K, \dots) to identify gravitational anomalies and stable orbits beyond 1000K.

5. Conclusion and Earth's Scientific Well-being.

The Universal Rule of Seven Provides a digital blueprint of cosmic dynamics. By acknowledging these mathematical Coordinates, the scientific community can systematically locate the remaining members of our Solar family. This model aims to harmonize theoretical Physics with observable cosmic resonance.

Mathematical Blueprint

The Primary equation for calculating any Planet's distance in this model is: Distance (D) $= n \times K$

Where:

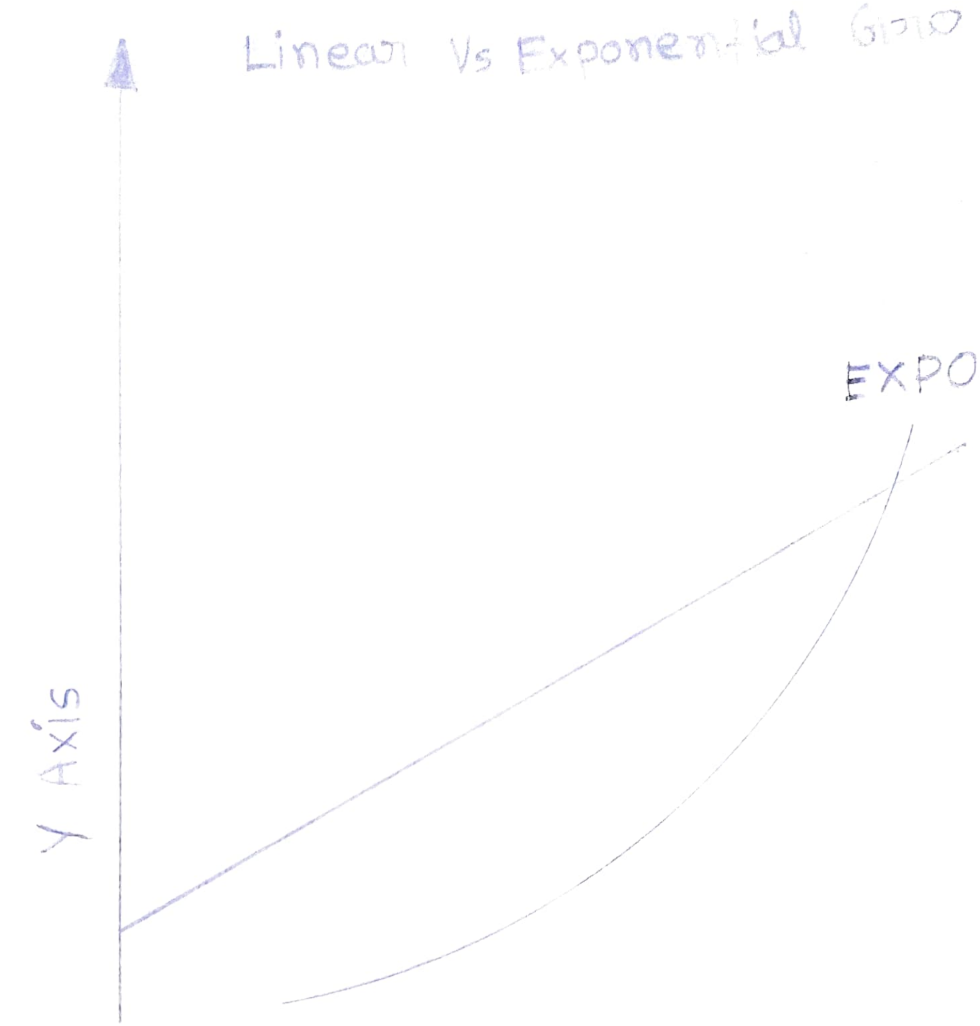
D = Mean distance of the planet from the sun.

n = Specific integer or Harmonic Point assigned to the planet.

K = The fundamental constant (approx. 0.0553 AU)

where the constant K\approx 0.0553 AU, and n represents the specific 'Harmonic Paint' (an integer) for each Planet.

The core mathematical sequence for this blueprint is: n = \{7, 13, 18, 28, 94, 173, 347, 544, 714\}



when plotting this data, a Key consideration is how to accurately depict the "Great Jumps" in distance - specifically between Mars ($n = 28$) and Jupiter ($n = 94$), and between Neptune ($n = 544$) and Pluto ($n = 714$).

If we use a standard linear scale, the inner planets will be clustered very close together on the graph, and the line will spike steeply after Mars. A logarithmic scale, on the other hand, would space out the Paints to display the proportional distances more clearly.

□ Graphical Design Layout

For a Precies graphical representation, we need to define the X-axis and Y-axis. Below is the data table that serves as the foundation for the graph: Planetary Sequence (X-axis) Planet value of n (Y-axis)

1. Mercury 7
2. Venus 13
3. Earth 18
4. Mars 28
5. Jupiter 94
6. Saturn 173
7. Uranus 347
8. Neptune 544
9. pluto 714

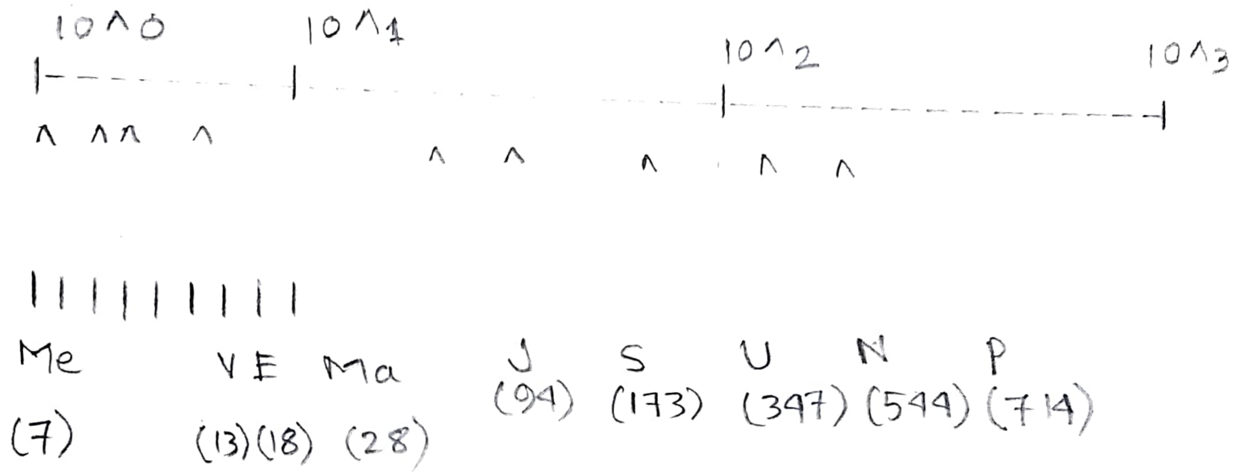
Graphical Design Layout: The Universal Rule of Seven.

According to the mathematical blueprint of the K7 Theory, plotting the planetary sequence on a standard linear scale would cause the inner planets to cluster too closely together while the line spikes steeply after Mars. Therefore, using a logarithmic scale is necessary to clearly display the proportional distances and accurately reveal the "Great Jumps" between the celestial bodies.

Here is the conceptual visualization of the Planetary Sequence mapped by their Harmonic Points (n) on a logarithmic scale:

Logarithmic Representation of Planetary Harmonic Points (n)



Legend:

Me = Mercury (n=7)

V = Venus (n=13)

E = Earth (n=18)

Ma = Mars (n=28)

J = Jupiter (n=94)

S = Saturn (n=173)

V = Uranus (n = 347)

N = Neptune (n = 544)

P = Pluto (n = 714)

This layout visually demonstrates the dense clustering of the terrestrial inner planets, followed by the massive proportion -al leaps transitioning to the gas giants and the outer boundaries of the system across the Mars-Jupiter and Neptune-Pluto gaps.

THE K7 HARMONIC BLUEPRINT

A UNIFIED MATHEMATICAL MODEL FOR SOLAR SYSTEM ARCHITECTURE

CONFIDENTIAL DRAFT

I. THE PRINCIPLE AND THE CONSTANT

CORE EQUATION

$D = n \times K$

D = quantize orbital Distance

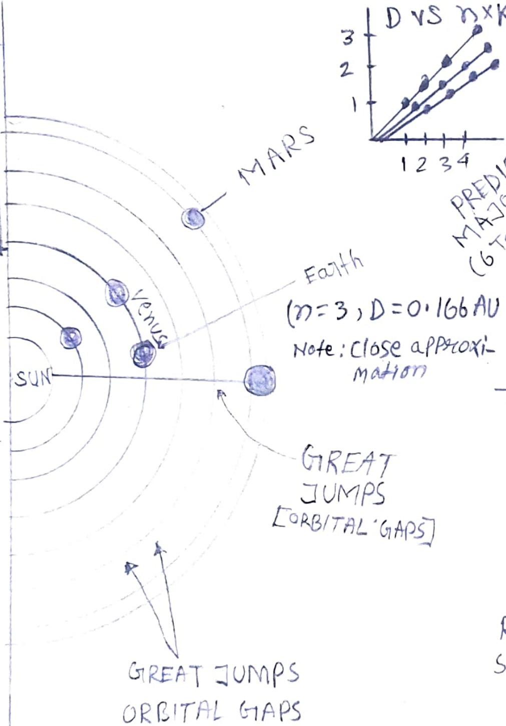
N = Integer Harmonic point

K = Fundamental Spacing constant

CALIBRATION CONSTANT:

$K \approx 0.0553\,AU$

II. QUANTIZED DISTRIBUTION MAP



III. THE FULL 14-BODY HARMONIC SYSTEM
